

Project Design Phase
Proposed Solution Template

Date	June - 20 - 2026
Team ID	SWTID-2026-9984
Project Name	BOOK STORE
Maximum Marks	2 Marks

Proposed Solution Matrix

The project team has filled out the parameters below describing the final proposed application:

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Connecting book readers with vetted local bookshops directly on a single platform that consolidates purchasing, wishlist management, format choices, and reading progress tracking.
2	Idea / Solution description	BookEase is a full-stack MERN (MongoDB, Express, React, Node.js) web application. It implements three distinct user roles (Admin, Seller, Buyer). Sellers can list books with format types (E-book/Paperback) and stock limits. Buyers can buy books, save items to a wishlist, write verified reviews, and update their reading progress.
3	Novelty / Uniqueness	The integration of purchase checkout, vendor-level inventory control (with admin vetting), and active social reading logs (0-100% progress tracking) under a unified, clean user dashboard.
4	Social Impact / Customer Satisfaction	Enables small independent bookstores to sell online without complex overhead. Increases buyer retention by adding fun reading progress elements and transparent reviews.
5	Business Model (Revenue Model)	Platform takes a small flat commission on completed sales from sellers. Offers premium, sponsored slots for book highlights on the homepage.

6	Scalability of the Solution	The system uses a decoupled three-tier architecture (React/Vite for frontend, Express API Gateway/Server for backend logic, and MongoDB document collection for quick querying). It can be horizontally scaled using standard cloud servers (e.g. AWS or Render).
